

## ON-SITE AUDITS

RCT offers ControlMaster® On-site Audits for mobile machine, low voltage electrical systems (12-24 VDC).

The audits are designed to provide a comprehensive inspection and report on the harnesses and their connections, switches, lighting, charging, starting, operator controls and gauges, fuses, circuit breakers, junction boxes and other ancillary electrical equipment.

The detailed report includes images of any identified high-risk damage, and recommended repair methods, as well as preventative maintenance schedules for each machine, inspected.

RCT can audit mobile machines and vehicles to site requirements, or to RCT's industry standards that have been developed over years of specialised mining experience.

RCT's dedicated customer service team is at the forefront of their field; with the experience and skills needed to perform on-site audits in the ever-changing mining environment.

An important part of the RCT ControlMaster® On-site Audit is to provide a comprehensive documentation of auditing and traceability for maintenance planning, repair and/or upgrades in the future.

### BENEFITS:

- Safety integrity
- Recommended improvements
- Suggested preventative maintenance programs
- Report on the condition of machine components
- Full documentation to support findings

All of which help to prevent costly unplanned downtime in the future.

Please note: Custom designed audits are available upon request.
